

DEXSORB®

PFAS Adsorbent for Environmental Monitoring

High Selectivity to PFAS

DEXSORB® is a novel cyclodextrin adsorbent, designed for the treatment and environmental monitoring of PFAS (poly- and perfluoroalkyl substances). Independent research and cross-lab validation studies have proven DEXSORB® to be broadly applicable for advanced analysis of PFAS. Superior features include: (i) rapid extraction of diverse PFAS, (ii) simple elution with quantitative PFAS recovery, (iii) consistent performance in various matrices, and (iv) low cost. These features derive from DEXSORB®'s unique adsorption mechanism of binding within uniform 0.78-nm cyclodextrin cavities, which provide molecular-level PFAS selectivity by size-inclusion and shielding from matrix effects by size-exclusion.

Point of Site Extraction

DEXSORB®'s rapid kinetics and high capacity enable Point of Site extraction of 55 PFAS analytes. See Appendix A for full list. Sampling by this method, tests water sources in real-time under actual conditions, and avoids costs and delays involved with water collection and transport.

Quantifiable Elution

DEXSORB is compatible with analytical applications like solid-phase extraction (SPE) and passive sampling. With no requirement of complex conditioning, DEXSORB can be simply applied in forms of WTK, SPE cartridges, and passive samplers to extract PFAS in diverse matrices from drinking water to wastewater. Extracted PFAS can be quantitatively recovered by a simple elution step using methanol amended with ammonia acetate. Cyclopure extraction and elution methods are in use by [SGS Laboratories in Belgium](#).

Analytical Methods

Cyclopure analytical laboratory employ isotope dilution methods for PFAS measurement on a HPLC-MS/MS (QExactive hybrid quadrupole orbitrap, ThermoFisher).

Sorbent Properties

Polymer Structure	crosslinked cyclodextrin
Appearance	yellow powder or granule
Adsorption Mechanism	hydrophobic & electrostatic
Bulk Density (wet)	0.40 g/mL; 0.40 kg/L
Specific Gravity	1.1
Effective Size (powder)	20 to 150 µm
Effective Size (granule)	200 to 2000 µm.

The analysis of drinking water samples is validated to the requirements of EPA Methods 537 and 533, whereas analysis of other matrices like groundwater, surface water, wastewater and landfill leachate follow the criteria set out in the newly released EPA 1633 draft. All methods follow instrument procedures for internal standardization and calibration certification.

PFAS Water Test Kit (WTK)

Cyclopure developed a PFAS test kit using DEXSORB® under a grant from NIEHS to provide a convenient, affordable and accurate way to detect PFAS compounds. WTK enables highly accurate Point of Site sample extraction by simply passing the water sample through a DEXSORB loaded extraction disc, followed by recovery and analysis at Cyclopure lab. To date, Cyclopure has tested and reported on **over 2,000 water samples in 42 States across the U.S.** The kit is being used by research institutions, including University of Florida, University of Cincinnati, University of Rhode Island and University of Queensland (Australia). NIEHS has this kit listed under its [SBIR STTR Sensor Technology for the 21st Century](#).

Commercial Monitoring

DEXSORB use in passive sampling is commercially applied in a [PFAS monitoring product](#) offered by iFLUX Sampling in Europe, and being explored by the University of Rhode Island under an [EPA Superfund Grant](#).

Making water safe. For everyone. Everywhere.
